alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, urinary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma. This sequence shows the generic formula of the alpha-conotoxins.
                                                                                               The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The

The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha conocoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal incotinic manner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon
                                                                                                                                                                                              acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, urinary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; foetal liver; gene expression; single exon nucleic acid probe.

The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                      Protein #6434 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Single exon nucleic acid probes for analyzing gene expression in human hearts
nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                           Human brain expressed single exon probe encoded protein SEQ ID NO: 32664.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Single exon nucleic acid probes for analyzing gene expression in human
                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of single exon nucleic acid

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

The present invention provides the protein shown in SEQ ID NO: 3 in the specification. It can be used for the diagnosis, treatment and prevention of opportunistic infections, septicaemia, drug intoxication, phthisis, cancers, liver dysfunction, immune dysfunction and dyshormonism. The present sequence is a peptide described in the exemplification of the
of opportunistic infections, septicaemia, drug intoxication, phthisis, cancers, liver dysfunction, immune dysfunction and dyshormonism. The present sequence is a peptide described in the exemplification of the

ö The present invention provides the protein shown in SEQ ID NO: 3 in the specification. It can be used for the diagnosis, treatment and prevention of opportunistic infections, septicaemia, drug intoxication, phthisis, cancers, liver dysfunction, immune dysfunction and dyshormonism. The present sequence is a protein described in the exemplification of the New polypeptide and its DNA, useful for diagnosis, treatment and prevention of infection, septicemia, drug intoxication, cancer, liver and immune dysfunction -Gaps ö Length 25; Indels Score 49; DB 22; Pred. The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide #7461 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             microarray; human; placenta; antenatal diagnosis;

This sequence represents a fragment of a secreted human protein encoded by the nucleic acid molecule detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAZ73102) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 123 novel genes and their fragments (nucleic acid sequences: AAX27311 x27449; amino acid sequences AAX02650-Y02788) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polymucleotides. Specific uses are described for each of the 123 polymucleotides, based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Moore PA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to single exon nucleic acid probes (SENP: see AA13115-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

ion

McIntosh JM;

The sequence is a cone snail O-superfamily conotoxin peptide.

The peptides are useful for regulating the flow of sodium through sodium channels in an individual and the treatment or prevention of disorders associated with voltage gated ion channel disorders.

Including demyellnating diseases i.e. multiple sclerosis, optic neuromyelitis, disseminated encephalomyelitis, adrenoleukodystrophy.

Coute transverse myelitis, progressive multifocal leukoencephalopathy, sub acute transverse myelitis, progressive multifocal leukoencephalopathy, belizaeus-Merzbacher disease, spinal cord injury, botulinum toxin poisoning, Huntington's, compression, entrapment neuropathies i.e. ulnar nerve palsy, and carpal tunnel syndrome, cardiovascular disorders, i.e. cardiac arrhythmias and congestive heart failure, reactive gliosis, hyperglycaemia, immunosuppression, cocaine addiction, cancer, cognitive dysfunction, neurotransmitter disorders (i.e. Eaton-Lambert syndrome) and reversal of curare and other neurotoxic injury associated with hypoxia, anoxia or ischaemia. The neurotoxic injury associated with stroke, cerebrovascular accident, comings, suffocation, perinatal asphyxia or hypoglycaemic events. The disorder is abin i.e. migraine, acute pain, persistent pain, neuropathic pain, nociceptive pain. The disorder is inflammation or a cardiovascular disorder. A conotoxin peptide of is useful to a pain and to trast disorder a disorder and to trast disorder a disorder and to trast disorder and an animal in pain or about to be subjected to a pain causing event, and to treat disorders associated with radical depolarisation of excitable membranes by activating a KATP channel, the disorders include cardiac, ocular and cerebral ischaemia and asthma. 26 AA; Sequence

Claim 2; Page 25; 277pp; English.

The sequence is a cone snail O-superfamily conotoxin peptide.

The peptides are useful for regulating the flow of sodium through sodium channels in an individual and the treatment or prevention of disorders associated with voltage gated ion channel disorders, optic including demyelinating diseases i.e. multiple sclerosis, optic neuromyelitis, disseminated encephalomyelitis, adrenoleukodystrophy.

Could for acute transverse myelitis, progressive multifocal leukoencephalopathy, sub acute sclerosing pancephalomyelitis (SSPE), metachromatic leukodystrophy, Pellizaeus-Merzbacher disease, spinal cord injury, botulinum toxin poisoning, Huntington's, compression, entrapment neuropathies i.e. ulnar nerve palsy, and carpal tunnel syndrome, cardiovascular disorders, i.e. cardiac arrhythmias and congestive heart failure, reactive gliosis, hyperglycemia, immunosuppression, cocaine addiction, cancer, cognitive dysfunction, neurotransmitter disorders (i.e. Eaton-Lambert syndrome) and reversal of curare and other addiction, cancer, cognitive dysfunction, neurological disorder is a setzure, preferably one associated with hypoxia, anoxia or ischaemia. The neurotoxic injury associated with hypoxia, anoxia or ischaemia. The neurotoxic injury associated with hypoxia, encotovascular accident, brain or spinal cord trauma, myocardial infarct, physical trauma, drownings, suffocation, perinatal asphyxia or hypoglycaemic events. The disorder is pain, nociceptive pain. The disorder is inflammation or a cardiovascular disorder. A conotoxin peptide of is useful to alleviate pain in a mammal in pain or about to be subjected to a pain causing event, and to treat disorders associated with radical capinal conders is not or excitable membranes by activating a KAPP channel, the depolarisation of excitable membranes by activating a submaniane and asthma.

                                                                                                                       g
                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in itssue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in dagnostics, forensics, gene mapping, identification of mutations or responsible for genetic disorders or other traits to assess on the property.
                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                     Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

```
This peptide represents a delta-conotoxin peptide from the venom of the cone snail, Conus gloriamaris. Such venoms disrupt essential organ systems and contain molecules directed to receptors and ion channels of meuromuscular systems. This peptide activates sodium channels and is useful as a pesticide e.g. against snails and slugs. It can also be used in the production of transgenic plants. The peptides can be chemically synthesised or could be produced by recombinant DNA methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analgesic peptide; venom; GSAF I; GSAF II; pain; cancer; neuropathy; organ inflammation; surgical intervention; burn; screening assay.

    useful as gastropodicides or sodium channel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analgesic peptide GSAF I from venom of G. spatulata.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the treatment of pain by administration of an analgesic peptide from the venom of the Chilean pink tarantula spider, Grammosticla spatulata. The peptides induce analgesia to treat pain of any origin, but especially moderate to severe pain associated with surgery and cancer. Also (not claimed) the peptides are used to raise specific antibodies; to identify compounds that mimic their activity (potential analgesis) and to study anatomical sites and mechanisms of their activity. Prior exposure to morphine does not affect the activity of the peptides, nor produce cross-tolerance. The present sequence

The present sequence is a Conus gloriamaris delta-conotoxin GMVIA. Conotoxins are isolated from the venom of cone snails. Nucleic acids encoding conotoxins may be used for the recombinant production of conotoxin peptides which are useful as tools for immobilishing skeletal muscle without affecting axonal or synaptic effects, as reagents for investigative voltage-dependent calcium ion channels and for drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is a cone snail O-superfamily conotoxin peptide. The peptides are useful for regulating the flow of sodium through sodium channels in an individual and the treatment or prevention of disorders associated with voltage gated ion channel disorders, including demyelinating diseases i.e. multiple sclerosis, optic neuromyelitis, disseminated encephalomyelitis, adrenoleukodystrophy, acute transverse myelitis, progressive multifocal leukoencephalopathy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New O-superfamily polypeptides useful for treating voltage gated ion channel disorders, including demyelinating diseases i.e. multiple

                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                    The present sequence represents an analgesic peptide GSAF I isolated from the venom of Grammostola spatulata. The analgesic peptides GSAF I and GSAF II are used in methods of treating pain. They can also be used in methods for identifying compounds that mimic their analgesic activity. The compounds identified can be used to treat acute or chronic pain in mammals caused by e.g. burns, cancer, neuropathies, organ inflammation or surgical intervention. They can also be used for determining the mechanism of action of the peptides and in screening assays to identify other compounds that mimic the analgesic activity of the peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding conotoxin MrVIB precursor polypeptides which are useful as tools for immobilizing skeletal muscle, as reagents for investigative voltage-dependent calcium ion channels and for drug screening .

New O-superfamily polypeptides useful for treating voltage gated ion channel disorders, including demyelinating diseases i.e. multiple

sclerosis

Claim 2; Page 24; 277pp; English.

The sequence is a cone snail O-superfamily conotoxin peptide.

The peptides are useful for regulating the flow of sodium through sodium channels in an individual and the treatment or prevention of disorders associated with voltage gated ion channel disorders, including demyelinating diseases 1.e. multiple sclerosis, optic neurowyelitis, diseaminated encephalomyelitis, adrenoleukodystrophy, caute transverse myelitis, progressive multifocal leukoencephalopathy, sub acute sclerosing panceephalomyelitis (SSPE), metachromatic leukodystrophy, Pelizaeus-Merzbacher disease, spinal cord injury, botulinum toxin poisoning, Huntington's, compression, entrapment neuropathies i.e. unlar nerve palsy, and carpal tunnel syndrome, cardiovascular disorders, i.e. cardiac arrhythmias and congestive heart failure, reactive gliosis, hyperglycaemia, immunosuppression, cocaine addiction, cancer, cognitive dysfunction, neurotransmitter disorders

Cardiovascular blocking drugs. The neurological disorder is a seizure, preferably one associated with hypoxia, anoxia or ischaemia. The neurotoxic injury associated with hypoxia, anoxia or ischaemia. The controxic injury associated with hypoxia, erebroascular accident, brain or spinal cord trauma, myocardial infarct, physical trauma, drownings, suffocation, perinatel asphyxia or hypoglycaemic events. The migrathe pain, nociceptive pain. The disorder is inflammation or a cardiovascular disorder. A conotoxin peptide of is useful to a pain cancing event, and to treat disorders associated with radical accident pain or cardiovascular and to treat disorders associated with radical calleviate pain in a mammal in pain or a about to be subjected to a pain causing event, and to treat disorders associated with radical and accident pain.

Calleviate pain in a mammal in pain or a cusing event, and to treat disorders associated with radical and accident pain.

Calleviate pain in a mammal in pain or a cusing event, and to treat disorders associated with radical accident depolarisation of excitable membranes b

The peptide is useful in blocking Ca channels in cells, such as cells in the nervous system of a mammal, in the treatment of Ca channel-mediated diseases and conditions (e.g. angina, hypertnesion, cardlomyopathy, supraventricular arrhythmias, esophogeal achalasia, premature labor and Raynaud's disease. The peptides are obtained from the spider through the process of milking by electrical

New transient outward potassium channel inhibitors from spider venom – is used to treat cardiac arrhythmias and disorders of learning and memory such as Alzheimer's disease

Example 2; Page 18; 57pp; English.

The amino acid sequence of a peptide isolated from the venom of the spider Heteropoda venatoria which has an inhibitory effect on transient cutward potassium channels (TOPCS). The compound was isolated from the crude venom by conventional chromatographic methods e.g. reverse-phase HPLC. The sequence was determined using a pulse-liquid sequenator. The protein has a molecular mass of 3599 as calculated by ion-spray mass spectroscopy and a calculated of 10 of 5.41. The protein is thought to contain 3 disulphide bridges which can be broken by S-pyridilation prior to sequencing. The TOPC inhibitor (TOPCI) can be used to screen for TOPC activating agents (TOPCAS). The TOPCIs selectively block the outward currents in cardiac calls and in neurons. They can be used in the treatment of cardiac arrhythmias and in the treatment of disorders of learning and memory such as Alzheimer's disease, Parkinson's disease, multiple sclerosis, schizophrenia, epilepsy, stroke

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
and muscle spasticity. The compounds can also be used as insecticidal agents. The compound is related in activity to AAR63751-3.
                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune

disorder is pain i.e. migraine, acute pain, persistent pain, neuropathic pain, nociceptive pain. The disorder is inflammation or a cardiovascular disorder. A conotoxin peptide of is useful to alleviate pain in a mammal in pain or about to be subjected to a pain causing event, and to treat disorders associated with radical depolarisation of excitable membranes by activating a KATP channel, the disorders include cardiac, ocular and cerebral ischaemia and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

spider Heteropoda venatoria which has an inhibitory effect on transient cutward potassium channels (TOPCs). The compound was isolated from the crudward potassium channels (TOPCs). The compound was isolated from the cutward potassium channels (TOPCs). The compound sequenator. The Protein has a molecular mass of 3599 as calculated by ion-spray mass spectroscopy and a calculated by of $4. The Protein is thought to contain 3 disulphide bridges which can be broken by 5-pyridilation prior to sequencing. The TOPC inhibitor (TOPCI) can be used to screen for TOPC activating agents (TOPCAs). The TOPCIs selectively block the in the treatment of cardiac callythmias and in the treatment of cardiac calls and in neurons. They can be used in the treatment of cardiac calls and in the treatment of parning and memory such as Alzheimer's disease, calculating and memory such as Alzheimer's disease, and muscle spasticity. The compounds can also be used as insecticidal agents. The compound is related in activity to AAR63751-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The amino acid sequence of a peptide isolated from the venom of the
                                                                                                                                                                                                                                                                                                                                                      New transient outward potassium channel inhibitors from spider venom – is used to treat cardiac arrhythmias and disorders of learning and memory such as Alzheimer's disease

A method has been developed of identifying a compound which mimics the binding activity of a peptide with the present 31 amino acid sequence on a stretch-activated channel. The method comprises: (a) incorporating a detectable label into the peptide; (b) binding the labelled peptide to stretch-activated channel in a sample; (c) adding a test compound to the sample; and (d) detecting the binding activity of the test compound. The peptide is isolated from the venom of the Chilean pink tarantula spider (Grammostola spatulata), and is designated mechanotoxin or GSAF II. The peptide and its related compounds can be used for the treatment of arrhythmia.
                                     The present sequence represents a purified peptide from Grammostola spatulata spider venom. The peptide is referred to as alpha-mechanotoxin or GSAF II. The peptide is useful for mediating hypotonic cell swelling induced calcium increase in cells, and is especially useful for treating cardiac arrhythmia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying a compound which mimics a peptide on a stretch-activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chilean pink tarantula spider; Grammostola spatulata; venom; stretch-activated channel block; cell membrane; mechanotoxin; cardiac ventricular rhythm disturbance; GsAF II; antlarrhythmic;

                                                                                                                                                                                                                                                                                                                           analgesic peptide from the venom of the Chilean pink tarantula spider, drammostola spatulata. The peptides induce analgesia to treat pain of any origin, but especially moderate to severe pain associated with surgery and cancer. Also (not claimed) the peptides are used to raise specific antibodies; to identify compounds that mimic their activity (potential analgesics) and to study anatomical sites and mechanisms of their activity. Prior exposure to morphine does not affect the activity of the peptides, nor produce cross-tolerance. The present sequence represents a specifically claimed peptide from the venom of Grammostola
                                                                                                                                                                                                                                                                                                          The invention relates to the treatment of pain by administration of an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents an analgesic peptide GSAF II isolated from the venom of Grammostola spatulata. The analgesic peptides GSAF I and GSAF II are used in methods of freating pain. They can also be used in methods for identifying compounds that mimic their analgesic activity. The compounds identified can be used to treat acute or chronic pain in mammals caused by e.g. burns, cancer, neuropathies, organ inflammation or surgical intervention. They can also be used for determining the mechanism of action of the peptides and in screening assays to identify other compounds that mimic the analgesic activity of the peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                         The present sequence represents a generic formula for muO-conopeptide G28. The gene coding for the G28 propeptide (see AAB2056) of the cone snail Conus textile is given in AAA89348. muO-conopeptides such as G28 are useful as local anaesthetics for treating chronic, acute inflammatory or neuropathic pain. They have long-lasting anaesthetic activity and are particularly useful for spinal anaesthesia, either administered acutely for post operative pain or via an intrathecal pump for severe chronic pain, or for the treatment of pain in epithelial tissue. They are obtained by chemical synthesis or by recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  their coding sequences from a number of different species of cone small. These peptides are found in minute quantities in the venom of the smalls, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-connotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric milliary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present invention relates to a number of alpha-conotoxin peptides and

their coding sequences from a number of different species of cone small. These peptides are found in minute quantities in the venom of the smalls, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The and har conoctoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric

                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                          The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuronscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic
                                                                                                                                         alpha-conotoxin polypeptides derived from the venom of cone snails useful e.g. as neuromuscular blocking agents for use in surgery and for treating unipolar depression -
                                                                                                                                                                                                                                                                                                   acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, urinary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, urinary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                  alpha-conotoxin polypeptides derived from the venom of cone snails useful e.g. as neuromuscular blocking agents for use in surgery and for treating unipolar depression -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for
                                                                                                                                                                                                                                                                                                              present invention relates to a number of alpha-conotoxin peptides .r coding sequences from a number of different species of cone snai

alpha-conotoxin polypeptides derived from the venom of cone snails useful e.g. as neuromuscular blocking agents for use in surgery and for treating unipolar depression N-PSDB; AAA89452

Claim 39; Page 46; 229pp; English.

The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuronmuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic

```

The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, urinary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma. Claim 39; Page 47; 229pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          their coding sequences from a number of different species of cone small. These peptides are found in minute quantities in the venom of the smalls, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-connotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, uninary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a number of alpha-conotoxin peptides and

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.

The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in the content traits to assess biodiversity and account of the traits to assess biodiversity and account of the content assess and as a supplement.
                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 579,

Patent No. 6329197

GENERAL INFORMATION:

APPLICANT: Bard, Jonathan A.

TITLE OF INVENTION: USES THEREOF

TITLE OF INVENTION: USES THEREOF

TITLE OF SEQUENCES: 59

CORRESPONDENCE ADDRESS:

ADDRESSE: Cooper & Dunham LLp

STREET: 1185 Avenue of The Americas

CITY: New York

STATE: New York

COUNTRY: U.S.A.
                                                                                                   APPLICATE: Bard, Jonathan A.
TITLE OF INVENTION: DNA ENCODING GALANN GALR3 RECEPTORS AND

Sequence 2, Application US/09305639
Patent No. 6200778
GENERAL INFORMATION:
APPLICANT: Treco, Douglas A.
APPLICANT: Selden, Michael W.
APPLICANT: Selden, Richard F
TITLE OF INVENTION: GENOMIC SEQUENCES FOR PROTEIN PRODUCTION AND DELIVERY
FILE REFERENCE: 07236/016001
CURRENT APPLICANTION NUMBER: US/09/305,639
CURRENT FILING DATE: 1999-05-05
SEARLIER APPLICATION NUMBER: 60/084,663
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 11, Application US/07689693B

Patent No. 5231011

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Baldomero M. Olivera
TITLE OF INVENTION: Segregated Folding Determinants
TITLE OF INVENTION: for Small Disulfide-Rich Peptides
NUMBER OF SEQUENCES: 25
CORRESPONDENCE ADDRESS:
ADDRESSEE: Thorpe, No. 5231011th & Western
STREET: Sandy
CITY: Sandy
STATE: Utah
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 68;
Length 62;
                                       Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NAME/KEY: Prepropeptide sequence for three loop
NAME/KEY: conotoxin from Circler conotoxin from Conus
NAME/KEY: textile
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       COMPUTER READABLE FORM:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 14, Application US/09386493

Sequence 14, Application US/09386493

PATENT NO. 6262247

GENERAL INFORMATION:

APPLICANT: Kaser, Matthew R.

APPLICANT: Azimzai, Yalda

APPLICANT: Yue, Henry

TITLE OF INVENTON: POLYCYCLIC AROMATIC HYDROCARBON INDUCED MOLECULES

FILE REPERENCE: PO-0011 US

CURRENT FILING DATE: 1999-08-30

NUMBER OF SEQ ID NOS: 14

SOFTWARE: PERL Program
                APPLICANT: Kaser, Matthew R.
APPLICANT: Azimzai, Yalda
APPLICANT: Azimzai, Yalda
APPLICANT: Vue, Henry
TITLE OF INVENTION: POLYCYCLIC AROMATIC HYDROCARBON INDUCED MOLECULES
FILE REFERENCE: PB-0011 US
CURRENT APPLICATION NUMBER: US/09/386,493
CURRENT FILING DATE: 1999-08-30
NUMBER OF SEQ ID NOS: 14
SOFTWARE: PERL PROGram
